

Installation Guide

Deploy GokyuzuWebSpam on your cPanel/WHM server

STEP-BY-STEP · 8 STEPS

This document walks you through the full installation of GokyuzuWebSpam on your own cPanel/WHM server after purchase.

Audience: Server administrators, non-technical operators

Duration: ~30 minutes total (12 minutes if Docker is preinstalled)

Required: SSH root access, WHM login, post-purchase email

Before You Start

This document is designed to help your team install GokyuzuWebSpam from scratch. Every command below is copy-paste ready. If you get stuck at any point, email destek@gokyuzuhosting.com with a screenshot.

What you will need

- A WHM/cPanel Linux server (AlmaLinux 8+, CentOS 8+, Ubuntu 20.04+, RHEL 8+)
- SSH root access (user: root, port: 22)
- A domain pointing to your server (e.g. panel.yourcompany.com)
- Your purchase email (contains your license key)
- 4 GB RAM, 40 GB free disk minimum (8 GB recommended for 100+ accounts)

Warning: This installation runs on a PRODUCTION server. Use a separate host for testing or take a snapshot first. A wrong command can stop Exim mail service.

STEP 1 Check your post-purchase email

Estimated time: 2 min

Right after purchase you receive two emails:

1. Invoice & Terms — PDF invoice + terms of use
2. License Details — the critical data needed for installation

The license email contains:

```
Your License Key: MS-XXXXXXXXXXXXXXXXXXXXX
Plan:           Enterprise (30 days)
IP Address:     123.45.67.89 (your server IP)
Panel Domain:   panel.yourcompany.com
Install URL:    https://gokyuzuhosting.com/install.sh
Support:        destek@gokyuzuhosting.com
```

Warning: NEVER share your license key with anyone. This key is the lock of your server.

STEP 2 Connect to your server via SSH

Estimated time: 1 min

On Windows use PowerShell or PuTTY; on Mac/Linux open Terminal.

Run this command (use your own server IP):

```
ssh root@123.45.67.89
```

First time connecting? Type 'yes' + Enter, then your root password. The password does not appear as you type — that is normal.

Expected output: You should see: [root@server ~]#

Info: SSH requires port 22 to be open. If closed, use the provider's Console/VNC instead.

STEP 3 System update + Docker installation

Estimated time: 3-5 min

Note: If Docker is already installed, skip this step. To check:

```
docker --version
```

If a version appears (e.g. Docker version 24.0.7) skip to Step 4. If you see 'command not found', run:

```
# Install Docker + Docker Compose in one line
curl -fsSL https://get.docker.com | bash
systemctl enable --now docker
docker ps
```

Expected output: You should see an empty table: CONTAINER ID IMAGE ...

STEP 4 Run the GokyuzuWebSpam install script

Estimated time: 8-12 min

One command installs everything: MongoDB + Backend + Frontend + Nginx (with SSL) + WHM plugin registration.

```
curl -fsSL https://gokyuzuhosting.com/install.sh -o /root/install.sh
chmod +x /root/install.sh
bash /root/install.sh
```

The script will prompt you for:

```
>>> Enter your license key: [paste MS-... here]
>>> Panel domain:           panel.yourcompany.com
>>> Admin email:            you@yourcompany.com
>>> SSL certificate (Y/N):   Y
```

The script will automatically:

- Pull the MongoDB Docker container and start it
- Build backend + frontend Docker images
- Install Nginx reverse proxy (ports 80, 443)
- Obtain a Let's Encrypt SSL certificate
- Copy the WHM plugin to /usr/local/cpanel/whostmgr/docroot/cgi/mailshield/
- Wire up the Exim milter integration
- Register an auto-update cron (every 6 hours)

Expected output: When finished:
Installation successful! Click the MailShield icon in WHM.

STEP 5 Log in to WHM and open the plugin

Estimated time: 1 min

Open your browser and navigate to (your own IP):

```
https://123.45.67.89:2087
```

If a certificate warning appears, click 'Advanced' → 'Proceed' (WHM is self-signed).

Log in as root.

Scroll the left menu down to Plugins. Click the MailShield icon.

Expected output: The panel opens and a 'MASTER · 123.45.67.89' badge appears in the top-right.

All features are unlocked in the left menu.

Warning: If the MASTER badge is missing, your Master IP does not match. Email support so we can add your IP to the Trusted IP list manually.

STEP 6 Bind cPanel accounts to the panel (Optional)

Estimated time: 3 min

After installation your cPanel accounts are auto-discovered. Go to the Users page in the panel — you will see all your accounts.

Per account:

You can define per-account rate limits, whitelists and notification channels.

- Emails sent/received today
- Spam catch rate
- Quarantined mail count
- IP hygiene score

STEP 7 Test the mail engines

Estimated time: 5 min

Go to Engines in the panel. Verify these engines are green:

Test mail: The Mail Simulator ships with a phishing .eml. Press 'Simulate' to test the pipeline.

Engine	Purpose	Status
SpamAssassin	Content-based spam scoring	Active
ClamAV	Virus/malware scanning	Active
DCC / Razor / Pyzor	Bulk-mail fingerprint	Active
RBL / DNSBL	IP blacklists (Spamhaus etc.)	Active
SPF / DKIM / DMARC	Authentication	Active
LLM AI Classifier	AI classification	Optional

Expected output: If the result is QUARANTINE with a score of 70+, protection is working.

STEP 8 Wire up your notification channels

Estimated time: 5 min

Go to System → Settings → Notifications in the panel. Configure one or more:

Channel	How to connect	Cost
Email	SMTP settings (SendGrid/SES/Postfix)	Free
Slack	Incoming Webhook URL	Free
Discord	Channel Webhook URL	Free
Telegram	BotFather token + chat_id	Free
Browser Push	Auto-permission prompt	Free
SMS (Twilio)	Twilio API key required	Paid

Troubleshooting

Panel won't open / 502 Bad Gateway

Docker containers may not be running.

```
cd /opt/gokyuzuwebspam-app/deployment && docker compose ps
docker compose up -d
```

MASTER badge is missing

IP does not match. Verify the license.

```
curl -H 'X-Master-Key: MS-...' http://127.0.0.1:8001/api/admin/whoami
# is_master: true expected
```

Quarantine is empty

Check if the Exim milter is registered.

```
cat /etc/exim.conf.local | grep -i milter
# smtp_milters = inet:127.0.0.1:8891 expected
```

SSL certificate failed

The domain may not be pointing to the server.

```
dig +short panel.yourcompany.com
# Your server IP should appear
```

Stay Up to Date

Two ways to keep the panel updated when new versions ship:

Way 1: Automatic (Recommended)

An auto-update cron is installed. It checks for a new version every 6 hours.

```
cat /etc/cron.d/gws-autoupdate
```

Way 2: Manual

Update at any time with:

```
cd /opt/gokyuzuwebspam-app  
bash auto-update.sh
```

Info: A ~30-second downtime happens during upgrade. Mail Continuity queues messages and replays them once the server is back.

Help & Support

Channel	How	Response Time
Email	destek@gokyuzuhosting.com	24 hours
Panel Chat	In-panel message (bottom-right)	Business hours
Slack Community	gokyuzu.slack.com	Community
Documentation	In-panel docs tab	Instant

Installation Complete — Congratulations!

Your cPanel server is now protected by enterprise-grade mail security. Within the first 24 hours you will see thousands of blocked spam messages in the panel dashboard.
